### 20. Circuit model for amplitude damping

We want to prove that the following circuit models the amplitude damping operation

Recall that

$$R_y(\theta) = e^{-i\frac{\theta}{2}Y}$$

$$= \begin{bmatrix} \cos(\frac{\theta}{2}) & -\sin(\frac{\theta}{2}) \\ \sin(\frac{\theta}{2}) & \cos(\frac{\theta}{2}) \end{bmatrix}$$

Initially the two-qubit state is

$$(\alpha |0\rangle + \beta |1\rangle) |0\rangle = \alpha |00\rangle + \beta |10\rangle$$

After the controlled  $R_y$  gate it becomes

$$\alpha |00\rangle + \beta |1\rangle R_y(\theta) |0\rangle = \alpha |00\rangle + \beta |1\rangle \left(\cos(\frac{\theta}{2}) |0\rangle + \sin(\frac{\theta}{2}) |1\rangle\right)$$
$$= \alpha |00\rangle + \beta (\cos(\frac{\theta}{2}) |10\rangle + \sin(\frac{\theta}{2}) |11\rangle)$$

After the controlled not gate,

$$\alpha \left| 00 \right\rangle + \beta (\cos (\frac{\theta}{2}) \left| 10 \right\rangle + \sin (\frac{\theta}{2}) \left| 01 \right\rangle)$$

This is the effect of amplitude damping, with probability of 1 be switched to 0, or one photon being lost to environment, being  $\gamma = \sin^2(\frac{\theta}{2})$ .

# 21. Amplitude damping of a harmonic oscillator

The principal system, a harmonic oscillator, interacts with an environment, modeled as another harmonic oscillator, through the Hamiltonian:

$$H = \chi(a^{\dagger}b + b^{\dagger}a)$$

where  $a^{\dagger}$ , a and  $b^{\dagger}$ , b are the creation, annihilation operators for the principal and environment oscillators, respectively.

The time evolution of the coupled system is governed by the unitary operator:

$$U=e^{-iH\Delta t}$$

# 21.1. Operation elements. We recall some results for the harmonic oscillator:

$$\forall n \in \mathbb{N}, \quad a^{\dagger} | n \rangle = \sqrt{n+1} | n+1 \rangle$$

and similarly in the environment space

$$\forall n \in \mathbb{N}, \quad b^{\dagger} | n \rangle_b = \sqrt{n+1} | n+1 \rangle_b$$

Here we use the subscript b to differentiate the eigenvectors of the Hermitian operator  $bb^{\dagger}$  which live in the environment space from the eigenvectors of  $aa^{\dagger}$  in the principal space:

$$\begin{aligned} &\forall n \in \mathbb{N}, \quad bb^{\dagger} \left| n \right\rangle_b = (n+1) \left| n \right\rangle_b \\ &\forall n \in \mathbb{N}, \quad aa^{\dagger} \left| n \right\rangle = (n+1) \left| n \right\rangle \end{aligned}$$

Each set of vectors constitute an orthonormal basis:

$$\forall (n,m) \in \mathbb{N}^2, \quad \langle n|m\rangle = \begin{cases} 0 & \text{if } n \neq m, \\ 1 & \text{if } n = m. \end{cases}$$
  
=  $\delta_{nm}$ 

We also have

$$aa^{\dagger} - a^{\dagger}a = [a, a^{\dagger}]$$
$$= 1$$
$$bb^{\dagger} - b^{\dagger}b = [b, b^{\dagger}]$$
$$= 1$$

where 1 stands for the identity operator.

Each of the operators  $a, a^{\dagger}$  commutes with each of the operators  $b, b^{\dagger}$  since they act on different spaces

$$0 = [a^{\dagger}, b^{\dagger}]$$
$$= [a, b^{\dagger}]$$
$$= [a^{\dagger}, b]$$
$$= [a, b]$$

The Baker-Campbell-Hausdorff formula states that, for any operators A, G such that  $e^G$  exists,

$$e^{\lambda G} A e^{-\lambda G} = \sum_{n=0}^{+\infty} \frac{\lambda^n}{n!} C_n$$

where the operators  $C_n$  are defined recursively by

$$C_0 = A$$
 
$$C_1 = [G, A]$$
 
$$\forall n \in \mathbb{N}, \quad C_{n+1} = [G, C_n]$$

Lets compute a simplified expression for the operator  $Ua^{\dagger}U^{\dagger}$  acting on the product space:

$$Ua^{\dagger}U^{\dagger} = e^{-iH\Delta t}a^{\dagger}e^{iH\Delta t}$$

$$= \sum_{n=0}^{+\infty} \frac{(-i\Delta t)^n}{n!}C_n$$
(1)

The first commutators  $C_n$  are

$$C_0 = a^{\dagger}$$

$$C_1 = [H, a^{\dagger}]$$

$$= [\chi b^{\dagger} a, a^{\dagger}]$$

$$= \chi b^{\dagger} [a, a^{\dagger}]$$

$$= \chi b^{\dagger}$$

$$C_2 = [H, C_1]$$

$$= [\chi a^{\dagger} b, \chi b^{\dagger}]$$

$$= \chi^2 a^{\dagger} [b, b^{\dagger}]$$

$$= \chi^2 a^{\dagger}$$

from which it follows that

$$\forall n \in \mathbb{N}, \quad C_{2n} = \chi^{2n} a^{\dagger}$$
$$C_{2n+1} = \chi^{2n+1} b^{\dagger}$$

We now rewrite equation 1

$$Ua^{\dagger}U^{\dagger} = \sum_{n=0}^{+\infty} \frac{(-i\Delta t)^n}{n!} C_n$$

$$= \sum_{n=0}^{+\infty} \frac{(-i\Delta t)^{2n}}{(2n)!} C_{2n} + \sum_{n=0}^{+\infty} \frac{(-i\Delta t)^{2n+1}}{(2n+1)!} C_{2n+1}$$

$$= a^{\dagger} \sum_{n=0}^{+\infty} \frac{(-i\chi\Delta t)^{2n}}{(2n)!} + b^{\dagger} \sum_{n=0}^{+\infty} \frac{(-i\chi\Delta t)^{2n+1}}{(2n+1)!}$$

$$= a^{\dagger} \sum_{n=0}^{+\infty} (-1)^n \frac{(\chi\Delta t)^{2n}}{(2n)!} - ib^{\dagger} \sum_{n=0}^{+\infty} (-1)^n \frac{(\chi\Delta t)^{2n+1}}{(2n+1)!}$$

$$= \cos(\chi\Delta t)a^{\dagger} - i\sin(\chi\Delta t)b^{\dagger}$$

Let us now compute the effect of U on  $|0\rangle |0\rangle_b = |00\rangle$ :

$$\begin{split} U \left| 00 \right\rangle &= e^{-iH\Delta t} \left| 00 \right\rangle \\ &= \sum_{n=0}^{+\infty} \frac{(-iH\Delta t)^n}{n!} \left| 00 \right\rangle \end{split}$$

Since  $a|0\rangle = 0$  and  $b|0\rangle_b = 0$ , we have

$$H|00\rangle = 0$$

and

$$\forall n \in \mathbb{N}^*, \quad H^n |00\rangle = 0$$

from which it follows there is only one non nul term in the previous sum and

$$U|00\rangle = |00\rangle$$

Let us compute the effect of U on  $|1\rangle |0\rangle_b = |10\rangle$ :

$$\begin{split} U \left| 10 \right\rangle &= U a^{\dagger} \left| 00 \right\rangle \\ &= U a^{\dagger} \underbrace{U^{\dagger} U}_{=1} \left| 00 \right\rangle \\ &= U a^{\dagger} U^{\dagger} \left| 00 \right\rangle \\ &= \left( \cos(\chi \Delta t) a^{\dagger} - i \sin(\chi \Delta t) b^{\dagger} \right) \left| 00 \right\rangle \\ &= \cos(\chi \Delta t) \left| 10 \right\rangle - i \sin(\chi \Delta t) \left| 01 \right\rangle \\ &= \cos(\chi \Delta t) \left| 1 \right\rangle \left| 0 \right\rangle_{b} - i \sin(\chi \Delta t) \left| 0 \right\rangle \left| 1 \right\rangle_{b} \end{split}$$

Similarly,

$$\begin{split} \sqrt{n!}U \left| n \right\rangle \left| 0 \right\rangle_b &= \sqrt{n!}U \left| n0 \right\rangle \\ &= U(a^\dagger)^n \left| 00 \right\rangle \\ &= U(a^\dagger)^n U^\dagger U \left| 00 \right\rangle \\ &= (Ua^\dagger U^\dagger)^n \left| 00 \right\rangle \\ &= (\cos(\chi \Delta t) a^\dagger - i \sin(\chi \Delta t) b^\dagger)^n \left| 00 \right\rangle \end{split}$$

Since  $[a^{\dagger}, b^{\dagger}] = 0$ ,

$$\begin{split} \sqrt{n!}U |n\rangle |0\rangle_b &= \left(\sum_{k=0}^n \binom{n}{k} \cos^{n-k} (\chi \Delta t) (-i)^k \sin^k (\chi \Delta t) (a^{\dagger})^{n-k} (b^{\dagger})^k \right) |00\rangle \\ &= \sum_{k=0}^n \binom{n}{k} \cos^{n-k} (\chi \Delta t) (-i)^k \sin^k (\chi \Delta t) \sqrt{(n-k)!} \sqrt{k!} |n-k\rangle |k\rangle_b \end{split}$$

so that

$$U|n0\rangle = \sum_{k=0}^{n} \binom{n}{k} \sqrt{\frac{(n-k)!k!}{n!}} \cos^{n-k}(\chi \Delta t) (-i)^{k} \sin^{k}(\chi \Delta t) |n-k\rangle |k\rangle_{b}$$
$$= \sum_{k=0}^{n} \sqrt{\binom{n}{k}} \cos^{n-k}(\chi \Delta t) (-i)^{k} \sin^{k}(\chi \Delta t) |n-k\rangle |k\rangle_{b}$$

We can think of the number

$$\binom{n}{k}\cos^{2(n-k)}(\chi\Delta t)\sin^{2k}(\chi\Delta t)$$

as the probability of losing k quanta of energy to the environment.

Let  $E_m = \langle m|_b U |0\rangle_b$ ,  $m \in \mathbb{N}$  the operation elements of U. They are operators acting on the principal space. We can compute the action of  $E_m$  on  $|n\rangle$  (i.e. compute the nth column of the matrix of  $E_m$ ) from the previous formula:

$$\begin{split} E_{m} \left| n \right\rangle &= \left( \left\langle m \right|_{b} U \left| 0 \right\rangle_{b} \right) \left| n \right\rangle \\ &= \left\langle m \right|_{b} \left( U \left| n \right\rangle \left| 0 \right\rangle_{b} \right) \\ &= \left\langle m \right|_{b} U \left| n 0 \right\rangle \end{split}$$

First it is clear that if n < m,  $E_m |n\rangle = 0$ . Then if  $n \ge m$ ,

$$E_{m} |n\rangle = \langle m|_{b} \sum_{k=0}^{n} \sqrt{\binom{n}{k}} \cos^{n-k} (\chi \Delta t) (-i)^{k} \sin^{k} (\chi \Delta t) |n-k\rangle |k\rangle_{b}$$

$$= \sum_{k=0}^{n} \sqrt{\binom{n}{k}} \cos^{n-k} (\chi \Delta t) (-i)^{k} \sin^{k} (\chi \Delta t) |n-k\rangle \underbrace{\langle m|k\rangle_{b}}_{=\delta_{mk}}$$

$$= (-i)^{m} \sin^{m} (\chi \Delta t) \sqrt{\binom{n}{m}} \cos^{n-m} (\chi \Delta t) |n-m\rangle$$

This shows that the matrix of  $E_m$  has non nul elements only on the mth superior diagonal.  $E_m$  corresponds to the physical process of losing m quanta of energy to the environment.

We can also reconstruct the full formula for  $E_m$  using braket calculus:

$$E_{m} = E_{m} \sum_{n=0}^{+\infty} |n\rangle \langle n|$$

$$= \sum_{n=0}^{+\infty} E_{m} |n\rangle \langle n|$$

$$= \sum_{n=m}^{+\infty} E_{m} |n\rangle \langle n|$$

$$= (-i)^{m} \sin^{m}(\chi \Delta t) \sum_{n=m}^{+\infty} \sqrt{\binom{n}{m}} \cos^{n-m}(\chi \Delta t) |n-m\rangle \langle n|$$

Note that the sole effect of factor  $(-i)^m$  is to add a global phase so it may as well be omitted.

**21.2. Trace-preserving property.** Matrix calculus or braket calculus show that the matrices  $E_m^{\dagger}E_m$  are diagonals, with the first m elements are 0:

$$E_{m}^{\dagger}E_{m} = \sin^{2m}(\chi \Delta t) \left( \sum_{n=m}^{+\infty} \sqrt{\binom{n}{m}} \cos^{n-m}(\chi \Delta t) |n\rangle \langle n-m| \right) \left( \sum_{l=m}^{+\infty} \sqrt{\binom{l}{m}} \cos^{l-m}(\chi \Delta t) |l-m\rangle \langle l| \right)$$

$$= \sin^{2m}(\chi \Delta t) \sum_{n=m}^{+\infty} \sum_{l=m}^{+\infty} \sqrt{\binom{n}{m}} \sqrt{\binom{l}{m}} \cos^{n-m}(\chi \Delta t) \cos^{l-m}(\chi \Delta t) |n\rangle \underbrace{\langle n-m|l-m\rangle}_{=\delta_{nl}} \langle l|$$

$$= \sin^{2m}(\chi \Delta t) \sum_{n=m}^{+\infty} \binom{n}{m} \cos^{2(n-m)}(\chi \Delta t) |n\rangle \langle n|$$

It follows that the operator  $\sum_{m=0}^{+\infty} E_m^{\dagger} E_m$  is also diagonal, and diagonal elements are

$$\langle n|\sum_{m=0}^{+\infty} E_m^{\dagger} E_m|n\rangle = \sum_{m=0}^{+\infty} \langle n|E_m^{\dagger} E_m|n\rangle$$

$$= \sum_{m=0}^{n} \langle n|E_m^{\dagger} E_m|n\rangle$$

$$= \sum_{m=0}^{n} \binom{n}{m} \sin^{2m}(\chi \Delta t) \cos^{2(n-m)}(\chi \Delta t)$$

$$= (\sin^2(\chi \Delta t) + \cos^2(\chi \Delta t))^n$$

i.e.  $\sum_{m=0}^{+\infty} E_m^{\dagger} E_m = 1$  and the quantum operation is trace-preserving.

#### 22. Amplitude damping of a single qubit density matrix

Let

$$\rho = \begin{bmatrix} a & b \\ b^* & c \end{bmatrix}$$

The amplitude damping operation is defined by

$$\varepsilon_{AD}(\rho) = E_0 \rho E_0^{\dagger} + E_1 \rho E_1^{\dagger}$$

where

$$E_0 = \begin{bmatrix} 1 & 0 \\ 0 & \sqrt{1 - \gamma} \end{bmatrix}$$

$$E_1 = \begin{bmatrix} 0 & \sqrt{\gamma} \\ 0 & 0 \end{bmatrix}$$
(2)

Straightforward matrix calculus show that

$$E_0 \rho E_0^{\dagger} = \begin{bmatrix} a & b\sqrt{1-\gamma} \\ b^* \sqrt{1-\gamma} & c(1-\gamma) \end{bmatrix}$$

and

$$E_1 \rho E_1^{\dagger} = \begin{bmatrix} c\gamma & 0 \\ 0 & 0 \end{bmatrix}$$
$$= \begin{bmatrix} (1-a)\gamma & 0 \\ 0 & 0 \end{bmatrix}$$

because  $1 = \operatorname{Tr} \rho = a + c$ .

Thus we have

$$\varepsilon_{AD}(\rho) = \begin{bmatrix} a + (1-a)\gamma & b\sqrt{1-\gamma} \\ b^*\sqrt{1-\gamma} & c(1-\gamma) \end{bmatrix} \\
= \begin{bmatrix} 1 - (1-a)(1-\gamma) & b\sqrt{1-\gamma} \\ b^*\sqrt{1-\gamma} & c(1-\gamma) \end{bmatrix}$$
(3)

#### 23. Amplitude damping of dual-rail qubits

Let

$$|\psi\rangle = a|01\rangle + b|10\rangle$$

Applying  $\varepsilon_{AD} \otimes \varepsilon_{AD}$  to  $\rho = |\psi\rangle \langle \psi|$  is equivalent to applying unitary  $B \otimes B$  to  $|\psi\rangle$ , where  $B = e^{\theta(a^{\dagger}b - ab^{\dagger})}$ . Let's do this by making explicit the 2 environment qubits initially set to 0, dnoted by subscript b:

$$|\psi\rangle = a |01\rangle |00\rangle_b + b |10\rangle |00\rangle_b$$

$$\begin{split} B\otimes B \left|\psi\right\rangle &= a\left|0\right\rangle \left|0\right\rangle_b \left(B\left|1\right\rangle \left|0\right\rangle_b\right) + b(B\left|1\right\rangle \left|0\right\rangle_b \right) \left|0\right\rangle \left|0\right\rangle_b \\ &= a\left|0\right\rangle \left|0\right\rangle_b \left(\cos(\theta)\left|1\right\rangle \left|0\right\rangle_b + \sin(\theta)\left|0\right\rangle \left|1\right\rangle_b\right) + b(\cos(\theta)\left|1\right\rangle \left|0\right\rangle_b + \sin(\theta)\left|0\right\rangle \left|1\right\rangle_b\right) \left|0\right\rangle_b \\ &= a\cos(\theta)\left|0\right\rangle \left|0\right\rangle_b \left|1\right\rangle \left|0\right\rangle_b + a\sin(\theta)\left|0\right\rangle \left|0\right\rangle_b \left|1\right\rangle_b + b\cos(\theta)\left|1\right\rangle_b \left|0\right\rangle_b \left|0\right\rangle_b + b\sin(\theta)\left|0\right\rangle_b \left|1\right\rangle_b \left|0\right\rangle_b \\ &= a\cos(\theta)\left|0\right\rangle_b \left|1\right\rangle_b \left$$

We reorder the qubits to put the environments qubits at the end since we will trace them out:

$$B \otimes B |\psi\rangle = a\cos(\theta) |01\rangle |00\rangle_b + a\sin(\theta) |00\rangle |01\rangle_b + b\cos(\theta) |10\rangle |00\rangle_b + b\sin(\theta) |00\rangle |10\rangle_b$$

$$= |\varphi\rangle$$

$$(4)$$

Now we have to find the dual vector  $\langle \varphi |$  of this state. We can recall the not so trivial following facts related to product space: Let  $\{|a_i\rangle\},\{|b_j\rangle\}$  be basis of two Hilbert spaces A and B.

The dual of  $|a_ib_j\rangle = |a_i\rangle \otimes |b_j\rangle$  is

$$\langle a_i | \otimes \langle b_j | = \langle a_i b_j |$$

so that

$$\left\langle \varphi \right| = a^* \cos(\theta) \left\langle 01 \right| \left\langle 00 \right|_b + a^* \sin(\theta) \left\langle 00 \right| \left\langle 01 \right|_b + b^* \cos(\theta) \left\langle 10 \right| \left\langle 00 \right|_b + b^* \sin(\theta) \left\langle 00 \right| \left\langle 10 \right|_b$$

We have also

$$|a_k b_l\rangle \langle a_i b_j| = |a_k\rangle \langle a_i| \otimes |b_l\rangle \langle b_j|$$

We could then use equation 4 to compute the density  $|\varphi\rangle\langle\varphi|$ , but this would be a messy sum with 16 terms.

Since we will trace out the environment, we recall the partial trace formula:

$$\operatorname{Tr}_{B}(|a_{k}\rangle\langle a_{i}|\otimes|b_{l}\rangle\langle b_{j}|) = |a_{k}\rangle\langle a_{i}|\operatorname{Tr}(|b_{l}\rangle\langle b_{j}|)$$
$$= |a_{k}\rangle\langle a_{i}|\langle b_{l}|b_{j}\rangle$$

Since  $\{|00\rangle_b, |01\rangle_b, |10\rangle_b, |11\rangle_b\}$  is an orthonormal basis, there are only 6 out of 16 terms left after the partial trace operation:

It is a mixed state:

- with probability  $\gamma$ , the state is projected to  $|00\rangle$ , orthogonal to  $|\psi\rangle$ .
- with probability  $1 \gamma$ , state is unchanged.

Since  $|00\rangle$  is orthogonal to  $|\psi\rangle$ , one can detect amplitude damping errors with measurement operators:

$$M_0 = |00\rangle \langle 00|$$
 orthogonal projector on span $\{|00\rangle\}$   
 $M_1 = |01\rangle \langle 01| + |10\rangle \langle 10| + |11\rangle \langle 11|$  orthogonal projector on span $\{|01\rangle, |10\rangle |11\rangle\}$ 

- If the state decayed to  $|00\rangle$ , then with probability 1 the result of the measurement will be  $|00\rangle$ .
- Otherwise, with probability 1 the result of the measurement will be the original  $|\psi\rangle$ .

It can be easily checked that the quantum operation can be described with 3 operators:

 $E_0 \otimes E_0$  $E_0 \otimes E_1$  $E_1 \otimes E_0$  $E_1 \otimes E_1$ 

It is interesting to see that these operators are the restriction to span $\{|01\rangle, |10\rangle\}$  of the operators

where  $E_0, E_1$  are the operators of amplitude damping for single qubit, defined in 2.

#### 24. Spontaneous emission is amplitude damping

From equation (7.77) in the book, the time evolution of the single atom interacting with single photon is governed by unitary

$$U = e^{-i\delta t} |00\rangle \langle 00| + (\cos(\Omega t) + i\frac{\delta}{\Omega}\sin(\Omega t)) |01\rangle \langle 01|$$
$$+ (\cos(\Omega t) - i\frac{\delta}{\Omega}\sin(\Omega t)) |10\rangle \langle 10| - i\frac{g}{\Omega}\sin(\Omega t)(|01\rangle \langle 10| + |10\rangle \langle 01|)$$

the left label corresponds to the electric field, the right label corresponds to the atom. The derivation of this formula from the Hamiltonian can be found in appendix A.

The  $Rabi\ frequency$  is

$$\Omega = \sqrt{g^2 + \delta^2}$$

If we set  $\delta = 0$  and if g > 0, then  $\Omega = g$  and

$$U = |00\rangle \langle 00| + \cos(\Omega t)(|01\rangle \langle 01| + |10\rangle \langle 10|)$$
$$-i\sin(\Omega t)(|01\rangle \langle 10| + |10\rangle \langle 01|)$$

Let us apply U to

$$\begin{aligned} |\psi\rangle &= |0\rangle \left(a \left| 0 \right\rangle + b \left| 1 \right\rangle\right) \\ &= a \left| 00 \right\rangle + b \left| 01 \right\rangle\right) \end{aligned}$$

We find

$$U |\psi\rangle = a |00\rangle + b(\cos(\Omega t) |01\rangle - i\sin(\Omega t) |10\rangle)$$
  
=  $|\varphi\rangle$  (5)

Now we have to find the dual vector  $\langle \varphi |$  of this state. We can recall the not so trivial following facts related to product space: Let  $\{|a_i\rangle\},\{|b_j\rangle\}$  be basis of two Hilbert spaces A and B.

The dual of  $|a_ib_j\rangle = |a_i\rangle \otimes |b_j\rangle$  is

$$\langle a_i | \otimes \langle b_j | = \langle a_i b_j |$$

so that

$$\langle \varphi | = a \langle 00 | + b^* (\cos(\Omega t) \langle 01 | + i \sin(\Omega t) \langle 10 |)$$

We have also

$$|a_k b_l\rangle \langle a_i b_j| = |a_k\rangle \langle a_i| \otimes |b_l\rangle \langle b_j|$$

We could then use equation 5 to compute the density  $|\varphi\rangle\langle\varphi|$ , but this would be a ugly sum with 9 terms.

Since we will trace out the photon space, we recall the partial trace formula:

$$\operatorname{Tr}_{B}(|a_{k}\rangle\langle a_{i}|\otimes|b_{l}\rangle\langle b_{j}|) = |a_{k}\rangle\langle a_{i}|\operatorname{Tr}(|b_{l}\rangle\langle b_{j}|)$$
$$= |a_{k}\rangle\langle a_{i}|\langle b_{l}|b_{j}\rangle$$

Since  $\{|0\rangle, |1\rangle\}$  is an orthonormal basis of the state space A of the photon, there are only 5 out of 9 terms left after the partial trace operation over the photon (those where the bit for the photon is the same in the ket and in the bra):

$$\operatorname{Tr}_{A}(|\varphi\rangle \langle \varphi|) = (|a|^{2} + |b|^{2} \sin^{2}(\Omega t)) |0\rangle \langle 0| + ab^{*} \cos(\Omega t) |0\rangle \langle 1|$$

$$+ a^{*}b \cos(\Omega t) |1\rangle \langle 0| + |b|^{2} \cos^{2}(\Omega t)$$

$$= \begin{bmatrix} |a|^{2} + (1 - |a|^{2})\gamma & ab^{*}\sqrt{1 - \gamma} \\ a^{*}b\sqrt{1 - \gamma} & |b|^{2}(1 - \gamma) \end{bmatrix}$$

with  $\gamma = \sin^2(\Omega t)$ . Now compare with equation 3 and recall that

$$\rho = \begin{bmatrix} |a|^2 & ab^* \\ a^*b & |b|^2 \end{bmatrix}$$

to see that this is indeed the amplitude damping operation

**25**.

We consider the density operator

$$\rho = \begin{bmatrix} p & 0 \\ 0 & 1 - p \end{bmatrix}$$

The qubit is in state  $|0\rangle$  with probability  $p_0 = p$  and in state  $|1\rangle$  with probability  $p_1 = 1 - p$ . Let us compute T as a function of  $E_0$ ,  $E_1$  and p:

$$\mathcal{Z} = \frac{e^{-\frac{E_0}{k_B T}}}{p} = e^{-\frac{E_0}{k_B T}} + e^{-\frac{E_1}{k_B T}}$$

$$\Leftrightarrow \qquad \frac{1}{p} = 1 + e^{-\frac{E_1 - E_0}{k_B T}}$$

$$\Leftrightarrow \qquad \frac{1}{p} - 1 = e^{-\frac{E_1 - E_0}{k_B T}}$$

$$\Leftrightarrow \qquad \frac{1}{p} - 1 = e^{-\frac{E_1 - E_0}{k_B T}}$$

$$\Leftrightarrow \qquad -\frac{E_1 - E_0}{k_B T} = \ln(\frac{1 - p}{p})$$

$$\Leftrightarrow \qquad T = -\frac{1}{k_B} \frac{E_1 - E_0}{\ln(\frac{1 - p}{p})}$$

Assuming  $E_1 > E_0$ ,

- the regular amplitude damping case corresponds to  $T \to 0^+$ , p = 1.
- When  $T \to +\infty$ ,  $p \to \frac{1}{2}$ .

# Appendix A. Derivation of the formula of unitary evolution for atom photon interaction

We consider a system formed by a two-level atom and a cavity confined electric field. The Jaynes-Cummings Hamiltonian is

$$H = \delta Z + g(a\sigma_{-} + a^{\dagger}\sigma_{+})$$

where g is some constant which describes the strength of the interaction,  $\delta = \frac{\omega - \omega_0}{2}$  is the detuning,  $a^{\dagger}$ , a are respectively the creation, annihilation operators <sup>1</sup> on the single mode field, and  $\sigma_{\pm}$  are operators acting on the two-level atom, namely:

$$\sigma_{+} = \frac{1}{2}(X + iY)$$

$$= \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$$

$$\sigma_{-} = \frac{1}{2}(X - iY)$$

$$= \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$$

We recall

$$\forall n \in \mathbb{N}, \quad a^{\dagger} | n \rangle = \sqrt{n+1} | n+1 \rangle$$
$$a | n+1 \rangle = \sqrt{n+1} | n \rangle$$
$$a | 0 \rangle = 0$$

The first label corresponding to electric field, the second to atom, we have:

$$Z |00\rangle = |00\rangle$$

$$Z |01\rangle = -|01\rangle$$

$$Z |10\rangle = |10\rangle$$

$$a\sigma_{-} |00\rangle = 0$$

$$a\sigma_{-} |01\rangle = 0$$

$$a\sigma_{-} |10\rangle = |01\rangle$$

$$a^{\dagger}\sigma_{+} |00\rangle = 0$$

$$a^{\dagger}\sigma_{+} |01\rangle = |10\rangle$$

$$a^{\dagger}\sigma_{+} |10\rangle = 0$$

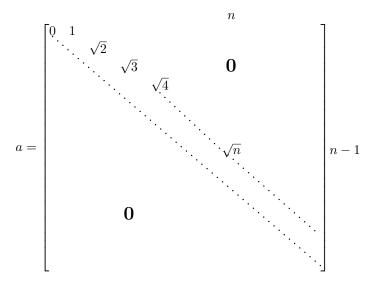

This shows that  $F = \operatorname{span}\{\ket{00}, \ket{01}, \ket{10}\}$  is an invariant subspace for H, i.e.  $H(F) \subset F$ . The same is true for  $H^n, n \in \mathbb{N}$  and  $U = e^{-iH\Delta t} = \sum_{n=1}^{\infty} \frac{(-i\Delta t)^n}{n!} H^n$ . Let's find the representation of H in the basis  $(\ket{00}, \ket{01}, \ket{10}, \ket{11})$ .

<sup>&</sup>lt;sup>1</sup>It seems to me the book mixes up  $a^{\dagger}$  with a in several places.

The representation of  $Z = I \otimes Z$  is

$$I \otimes Z = \left[ egin{array}{ccc} 1 oldsymbol{Z} & 0 oldsymbol{Z} \\ 0 oldsymbol{Z} & 1 oldsymbol{Z} \end{array} 
ight] \ = \left[ egin{array}{cccc} oldsymbol{Z} & 0 & 0 & 0 \\ oldsymbol{0} & oldsymbol{Z} \end{array} 
ight] \ = \left[ egin{array}{cccc} 1 & 0 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & -1 \end{array} 
ight]$$

The representation of annihilation operator in the  $(|n\rangle)_{n\in\mathbb{N}}$  basis of the electric field state space is

The representation of  $a \otimes \sigma_{-}$  is then

$$a \otimes \sigma_{-} = \begin{bmatrix} 0\sigma_{-} & 1\sigma_{-} \\ 0\sigma_{-} & 0\sigma_{-} \end{bmatrix}$$
$$= \begin{bmatrix} \mathbf{0} & \sigma_{-} \\ \mathbf{0} & \mathbf{0} \end{bmatrix}$$
$$= \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Similarly,

$$a^{\dagger} \otimes \sigma_{+} = \begin{bmatrix} 0\boldsymbol{\sigma}_{+} & 0\boldsymbol{\sigma}_{-} \\ 1\boldsymbol{\sigma}_{+} & 0\boldsymbol{\sigma}_{+} \end{bmatrix}$$

$$= \begin{bmatrix} \mathbf{0} & \mathbf{0} \\ \boldsymbol{\sigma}_{+} & \mathbf{0} \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Thus the representation of H in the basis  $(|00\rangle, |01\rangle, |10\rangle, |11\rangle)$  is

$$H = \begin{bmatrix} \delta & 0 & 0 & 0 \\ 0 & -\delta & g & 0 \\ 0 & g & \delta & 0 \\ 0 & 0 & 0 & -\delta \end{bmatrix}$$

The representation of the restriction of H in the basis  $(|00\rangle, |01\rangle, |10\rangle)$  is

$$H = egin{bmatrix} \delta & 0 & 0 \ 0 & -\delta & g \ 0 & g & \delta \end{bmatrix}$$
  $= egin{bmatrix} \delta & 0 & 0 \ 0 & m{H_1} \ 0 & \end{pmatrix}$ 

Block calculus shows that

$$e^{-iH\Delta t} = \begin{bmatrix} e^{-i\delta\Delta t} & 0 & 0 \\ 0 & e^{-iH_1\Delta t} \\ 0 & \end{bmatrix}$$

Let  $\Omega = \sqrt{g^2 + \delta^2}$ , the Rabi frequency.

$$H_1^2 = \begin{bmatrix} \Omega^2 & 0 \\ 0 & \Omega^2 \end{bmatrix}$$
$$= \Omega^2 I_2$$

This shows that

$$\forall n \in \mathbb{N}, \quad H_1^{2n} = \Omega^{2n} I_2$$
$$H_1^{2n+1} = \Omega^{2n} H_1$$

Then,

$$e^{-iH_1\Delta t} = \sum_{n=0}^{+\infty} \frac{(-i\Omega\Delta t)^{2n}}{(2n)!} I_2 + \frac{1}{\Omega} \sum_{n=0}^{+\infty} \frac{(-i\Omega\Delta t)^{2n+1}}{(2n+1)!} H_1$$

$$= \sum_{n=0}^{+\infty} (-1)^n \frac{(\Omega\Delta t)^{2n}}{(2n)!} I_2 - i\frac{1}{\Omega} \sum_{n=0}^{+\infty} (-1)^n \frac{(\Omega\Delta t)^{2n+1}}{(2n+1)!} H_1$$

$$= \cos(\Omega t) I_2 - i\frac{1}{\Omega} \sin(\Omega t) H_1$$

Finally the matrix U is

$$e^{-iH\Delta t} = \begin{bmatrix} e^{-i\delta\Delta t} & 0 & U_{|10\rangle} & U_{|10\rangle} \\ e^{-i\delta\Delta t} & 0 & 0 \\ 0 & \cos(\Omega t) + i\frac{\delta}{\Omega}\sin(\Omega t) & -i\frac{g}{\Omega}\sin(\Omega t) \\ 0 & -i\frac{g}{\Omega}\sin(\Omega t) & \cos(\Omega t) - i\frac{\delta}{\Omega}\sin(\Omega t) \end{bmatrix}_{|10\rangle}^{|01\rangle}$$
